NEW QUESTION: 1

In this section, you'll see one or more sets of questions with the same scenario and problem Each question presents a unique solution to the problem, and you must determine whether the solution meets the stated goals.

Any of the solutions might solve the problem. It is also possible that none of the solutions solve the problem.

Once you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen Note: This question is part of a series of questions that present the same scenario. Each

question in the series contains a unique solution. Determine whether the solution meets the stated goals.

Your network contains an Active Directory domain named contoso.com. The domain contains a DNS server named Server1. All client computers run Windows 10.

On Server1, you have the following zone configuration

You need to prevent Server1 from resolving queries from DNS clients located on Subnet4. Server1 must resolve queries from all other DNS clients. Solution: From a Group Policy object (GPO) in the domain, you modify the Network List Manager Policies. Does this meet the goal?

A. Yes

B. No

Answer: B

NEW QUESTION: 2

Your network contains an Active Directory domain named contoso.com. The domain contains a main office and a branch office. An Active Directory site exists for each office. The domain contains two servers named Server1 and Server2 that run Windows Server 2012 R2.

Both servers have the DHCP Server server role installed.

Server1 is located in the main office site. Server2 is located in the branch office site.

Server1 provides IPv4 addresses to the client computers in the main office site.

Server2 provides IPv4 addresses to the client computers in the branch office site.

You need to ensure that if either Server1 or Server2 are offline, the client computers can still obtain IPv4 addresses. The solution must meet the following requirements:

- The storage location of the DHCP databases must not be a single point of failure.

- Server1 must provide IPv4 addresses to the client computers in the branch office site only if Server2 is offline.

- Server2 must provide IPv4 addresses to the client computers in the main office site only if Server1 is offline.

Which configuration should you use?

A. a Network Load Balancing (NLB) cluster

B. load sharing mode failover partners

C. a failover cluster

D. hot standby mode failover partners

Answer: D

Explanation:

Explanation/Reference:

Explanation:

Needs to be a DHCP Failover option

Incorrect Answers:

A: The load sharing mode of operation is best suited to

deployments where both servers in a failover relationship are located at the same physical site.

B: Hot standby mode of operation is best suited to deployments where a central office or data center server acts as a standby backup server to a server at a remote site, which is local to the DHCP clients D: Needs to be a DHCP Failover option

NEW QUESTION: 3

You manage a cloud service that hosts a customer-facing application. The application allows users to upload images and create collages. The cloud service is running in two medium instances and utilizes Azure Queue storage for image processing.

The storage account is configured to be locally redundant. The sales department plans to send a newsletter to potential clients. As a result, you expect a significant increase in global traffic.

You need to recommend a solution that meets the following requirements:

- * Configure the cloud service to ensure the application is responsive to the traffic increase.

- * Minimize hosting and administration costs.

What are two possible ways to achieve this goal? Each correct answer presents a complete solution

- A.** Configure the storage account to be geo-redundant
- B.** Deploy a new cloud service in a separate data center. Use Azure Traffic Manager to load balance traffic between the cloud services.
- C.** Configure the cloud service to auto-scale when the queue exceeds 1000 entries per machine.
- D.** Configure the cloud service to auto-scale to three instances when processor utilization is above 80%.
- E.** Configure the cloud service to run in two Large instances.

Answer: C,D

Explanation:

Explanation

An autoscaling solution reduces the amount of manual work involved in dynamically scaling an application. It can do this in two different ways: either preemptively by setting constraints on the number of role instances based on a timetable, or reactively by adjusting the number of role instances in response to some counter(s) or measurement(s) that you can collect from your application or from the Azure environment.
