Explanation:

**NEW QUESTION: 2**

What is the maximum supporter number of vCPU per VM in VMware

vSphere 6.5?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: A**

**NEW QUESTION: 3**

Which two statements about the command `distance bgp 90 60 120` are true? (Choose two.)

- A. The internal distance it sets is preferred over the external distance.
- B. Implementing the command is a Cisco best practice.
- C. The external distance it sets is preferred over the internal distance.
- D. The local distance it sets may conflict with the RIP administrative distance.
- E. The local distance it sets may conflict with the EIGRP administrative distance.
- F. The internal distance it sets may conflict with the EIGRP administrative distance.

**Answer: A,D**

Explanation:

To allow the use of external, internal, and local administrative distances that could be a better route than other external, internal, or local routes to a node, use the `distance bgp` command in address family or router configuration mode. To return to the default values, use the `no` form of this command.

`distance bgp external-distance internal-distance local-distance no distance bgp`

Syntax Description

`external-` Administrative distance for BGP external routes.

External routes are

`distance` routes for which the best path is learned from a neighbor external to the

autonomous system. Acceptable values are from 1 to 255. The default is

20. Routes with a distance of 255 are not installed in the routing table.

`internal-` Administrative distance for BGP internal routes.

Internal routes are those

`distance` routes that are learned from another BGP entity within the same

autonomous system. Acceptable values are from 1 to 255. The default is

200. Routes with a distance of 255 are not installed in the routing table.

`local-` Administrative distance for BGP local routes. Local routes are those

distance networks listed with a network router configuration command, often as back doors, for that router or for networks that are being redistributed from another process. Accept table values are from 1 to 255. The default is 200. Routes with a distance of 255 are not installed in the routing table.

Defaults

external-distance: 20  
internal-distance: 200  
local-distance: 200

In this case, the internal distance is 60 and the external is 90, and the local distance is 120 (same as RIP).
