Answer: C,D,E
Explanation:
Explanation
A is correct: Oracle Restart improves the availability of your
Oracle database. When you install Oracle Restart, various
Oracle components can be automatically restarted after a
hardware or software failure or whenever your database host
computer restarts E is correct: Oracle Restart runs periodic
check operations to monitor the health of these components. If
a check operation fails for a component, the component is shut
down and restarted. B is also true About Startup Dependencies
Oracle Restart ensures that Oracle components are started in
the proper order, in accordance with component dependencies.
For example, if database files are stored in Oracle ASM disk
groups, then before starting the database instance, Oracle
Restart ensures that the Oracle ASM instance is started and the
required disk groups are mounted. Likewise, if a component must
be shut down, Oracle Restart ensures that dependent components
are cleanly shut down first. Oracle Restart also manages the

weak dependency between database instances and the Oracle Net listener (the listener): When a database instance is started, Oracle Restart attempts to start the listener. If the listener startup fails, then the database is still started. If the listener later fails, Oracle Restart does not shut down and restart any database instances.
