Which actions must you perform to support regional administration?

There are 3 correct answers to this question.

Response:

- A. Add sites for regional learning administrators
- B. Apply all domains to regional administrators
- C. Add roles for regional administrators
- D. Apply domain restrictions to workflows
- E. Add domain restrictions to the SuccessFactors Learning system

Answer: A,C,D

NEW QUESTION: 2

You have an Exchange Server 2013 organization that contains 5,000 mailboxes.

A user named User1 tests several Windows Phone devices. You need to ensure that User1 can connect more than 20 Windows Phone devices to his mailbox, Which cmdlet should you run?

- A. Set-MobileMailboxPolicy
- B. Set-ThrottlingPolicy
- C. Set-ActiveSyncMailboxPolicy
- D. Set-CasMailbox

Answer: B

NEW QUESTION: 3

Amazon Relational Database Service (Amazon RDS) Multi-AZ deployments provide enhanced availability and durability for Database (DB) Instances, making them a natural fit for production database workloads. When you provision a Multi-AZ DB Instance, Amazon RDS automatically creates a primary DB Instance and synchronously replicates the data to a standby instance in a different Availability Zone (AZ). Each AZ runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby (or to a read replica in the case of Amazon Aurora), so that you can resume database operations as soon as the failover is complete. Since the endpoint for your DB Instance remains the same after a failover, your application can resume database operation without the need for manual administrative intervention.

Which of the following is a benefit of Amazon RDS Multi-AZ deployments?

- A. Increased availability and durability
- B. Reduced cost
- C. Increased performance
- D. Increased security

Answer: A

Explanation:

Explanation

Amazon RDS Multi-AZ deployments provide enhanced availability and durability for Database (DB) Instances, making them a natural fit for production database workloads. When you provision a Multi-AZ DB Instance, Amazon RDS automatically creates a primary DB Instance and synchronously replicates the data to a standby instance in a different Availability Zone (AZ). Each AZ runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby (or to a read replica in the case of Amazon Aurora), so that you can resume database operations as soon as the failover is complete. Since the endpoint for your DB Instance remains the same after a failover, your application can resume database operation without the need for manual administrative intervention.
