NEW QUESTION: 3
A DevOps Engineer is deploying a new web application. The
company chooses AWS Elastic Beanstalk for deploying and
managing the web application, and Amazon RDS MySQL to handle
persistent data. The company requires that new deployments have
minimal impact if they fail. The application resources must be
at full capacity during deployment, and rolling back a
deployment must also be possible. Which deployment sequence
will meet these requirements?
A. Deploy the application using Elastic Beanstalk and connect
to an external RDS MySQL instance using Elastic Beanstalk
environment properties. Use Elastic Beanstalk features for a
blue/green deployment to deploy the new release to a separate
environment, and then swap the CNAME in the two environments to
redirect traffic to the new version.
B. Deploy the application using Elastic Beanstalk, and connect
to an external RDS MySQL instance using Elastic Beanstalk
environment properties. Use Elastic Beanstalk immutable updates
for application deployments.
C. Deploy the application using Elastic Beanstalk, and include
RDS MySQL as part of the environment. Use Elastic Beanstalk
immutable updates for application deployments.
D. Deploy the application using Elastic Beanstalk, and include
RDS MySQL as part of the environment. Use default Elastic
Beanstalk behavior to deploy changes to the application, and
let rolling updates deploy changes to the application.

Answer: A
